

then it somehow correlates with covid positive because well actually in the three cases that have high fever basically two.

- 0:05:28 : **of them had covid and if you check people coughing...** then we see that well they cough and it is positive they coughing it is positive and to other cases it is negative **so it doesn't tell you much information. what about the headache..** while the headache it's no for this positive.
- 0:05:48 : **guy it is not for a negative guy and it is not for a negative guy so in the cases where it is no two of the cases have been negative so maybe no headache is an indication that well you don't have covid perhaps** so you see those symptoms help you to actually.
- 0:06:08 : **get some knowledge about the data so is there a way to make use of them even though such combination does not occur directly in the data** when the naive bayes algorithm tells us away how to do it and we're going to find it out in a second.
- 0:06:40 : then assume that they are just independent so **don't try to find occurrences where they all appear together but treat them as occurring**
